NetID: Jnepo005

Student Responses

Answer the following questions

Question 1

When running the Keyboard Demo in QEMU after introducing the bug, briefly describe how it behaves differently than before. Try a few keystrokes in the QEMU window and describe what you see:

After introducing the bug, the QEMU window still opens, but typing keys are weird because instead of printing the full typed string after Enter, the output gets stuck or a little appears.

Question 2

What do you think is happening? The program continues to execute, but what happens after it returns from `irq_handler`? What C subroutine gets called over and over?

The interrupt didn't finish correctly, so after returning from `irq_handler`, i believe the CPU keeps jumping back into the interrupt handler. The timer interrupt subroutine gets called over and over.

Question 3

Look at the terminal where the buggy version is running, what messages are being printed out about the timers? Do the timers work in this buggy version?

The terminal keeps printing the timers on repeat. they are not working correctly because the program is stuck repeatedly handling the timer interrupt.
